Motivation

Observables vs Promises – Details

Observables (Streams)	Promises (Single Event)
More features	Less powerful
Can emit zero, one or multiple values over time.	Emit a single value at a time.
Lazy : they're not executed until we subscribe using the subscribe() method.	Eager: execute immediately after creation.
Subscriptions are cancellable using the unsubscribe() method, which stops the listener from receiving further values.	Are not cancellable .
RxJS provides a ton of functionality to operate on observables like the map, for Each, filter, reduce, retry, and retryWhen operators.	Don't provide any operations.
Deliver errors to the subscribers.	Push errors to the child promises.
Used by Angular in HTTP Client & Route Params	Used by Angular in Router.navigate

Example

Example with Pipeable Operators

```
import { map } from 'rxjs/operators';

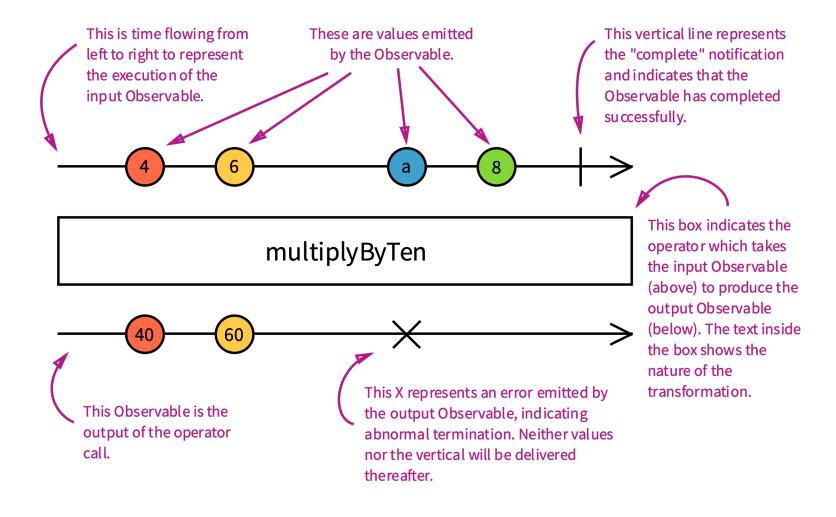

this.http.get("http://www.angular.at/api/...")
   .pipe(map(flightDateStr => new Date(flightDateStr)))
   .subscribe({
        next: (bookings) => { ... },
        error: (err) => { console.error(err); }
   });
```

Transformation Operators

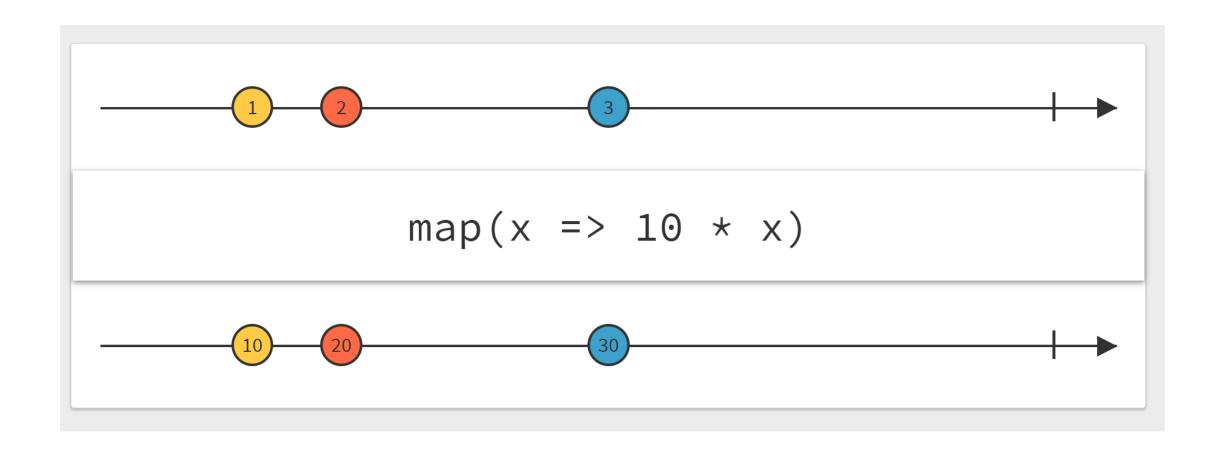

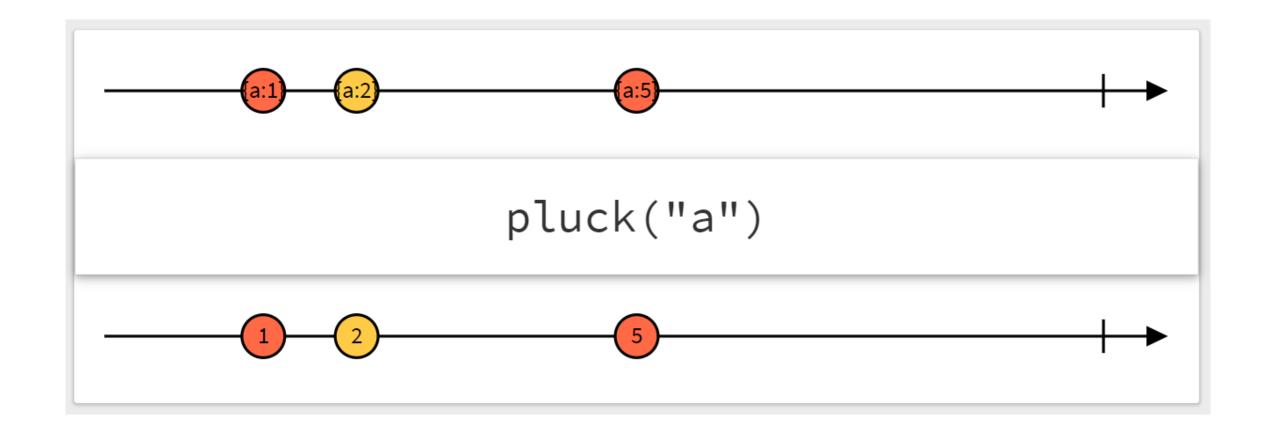

Operators

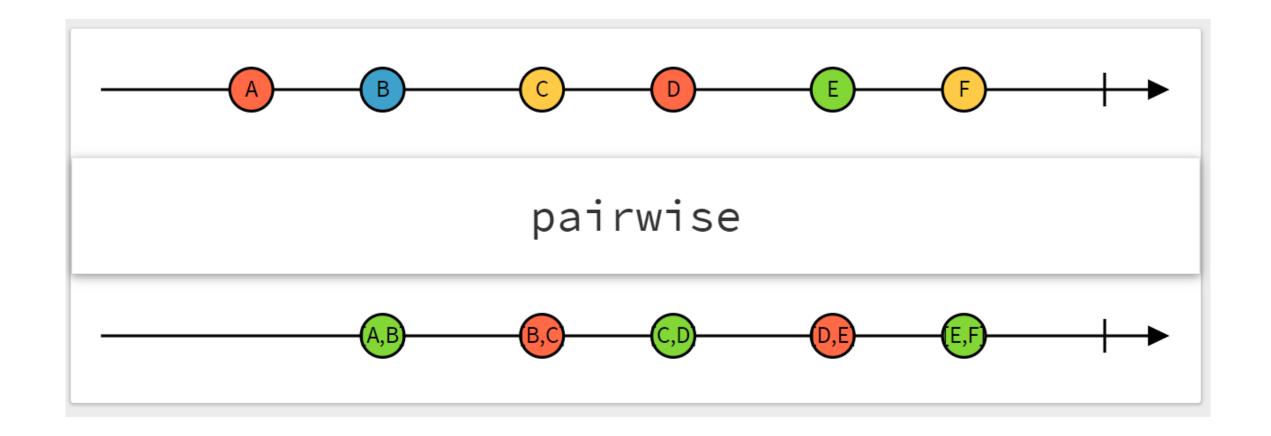

[https://rxjs.dev/guide/operators]

Operators

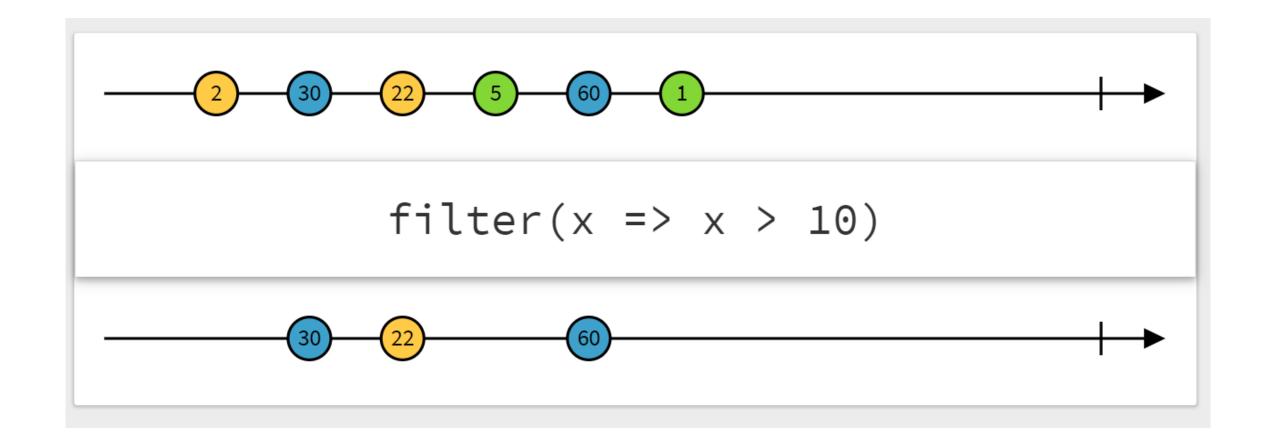

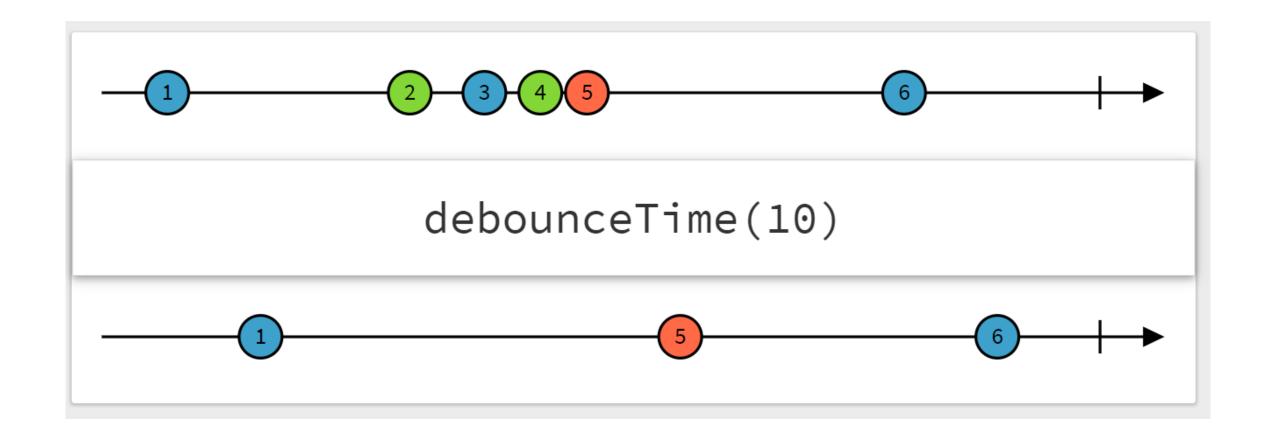

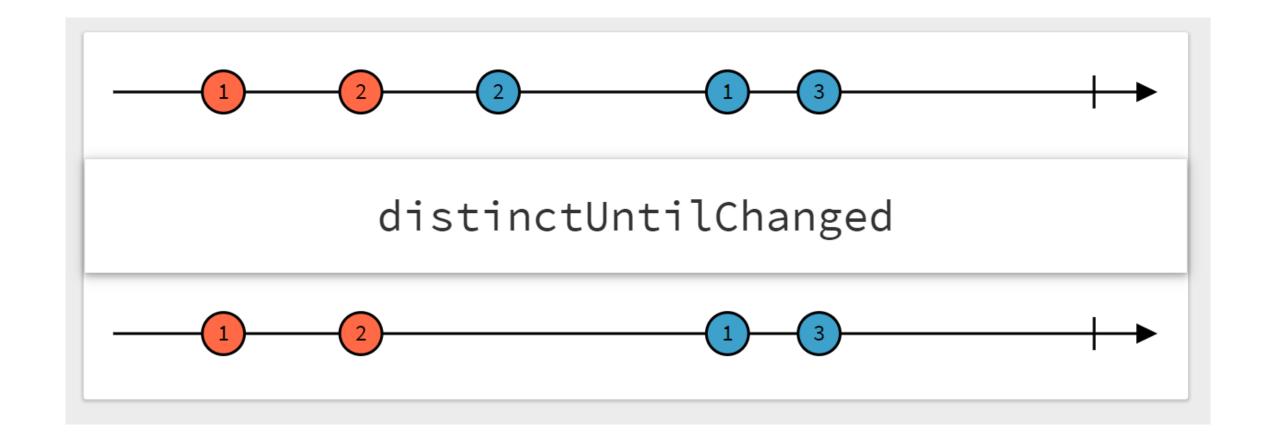

Filtering Operators

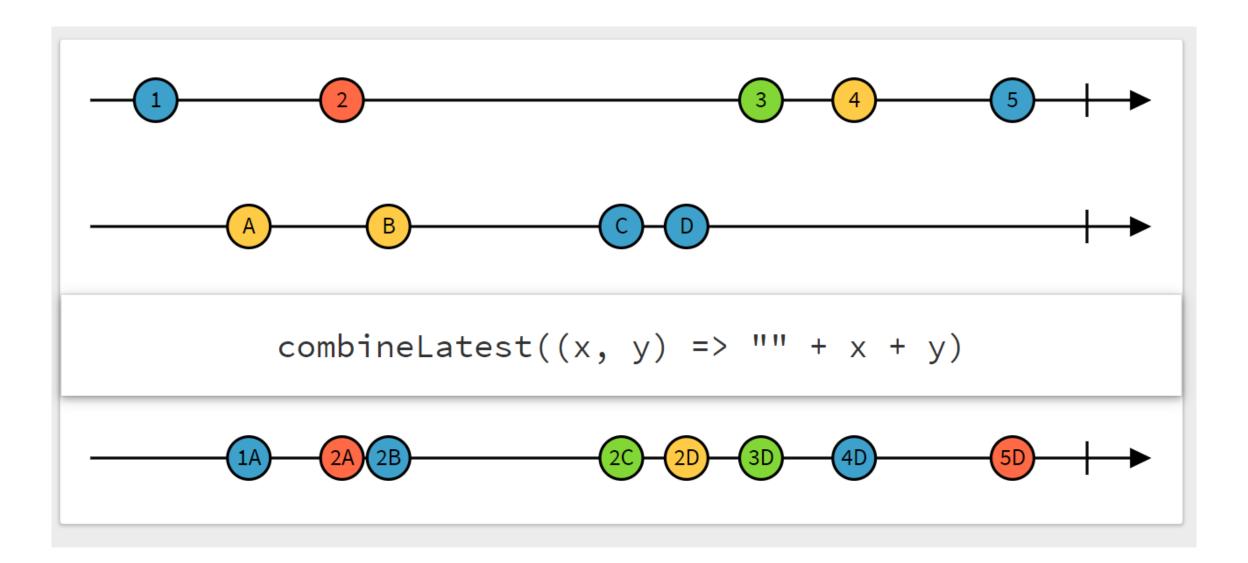

Demo

Simple Lookahead

Combination Operators

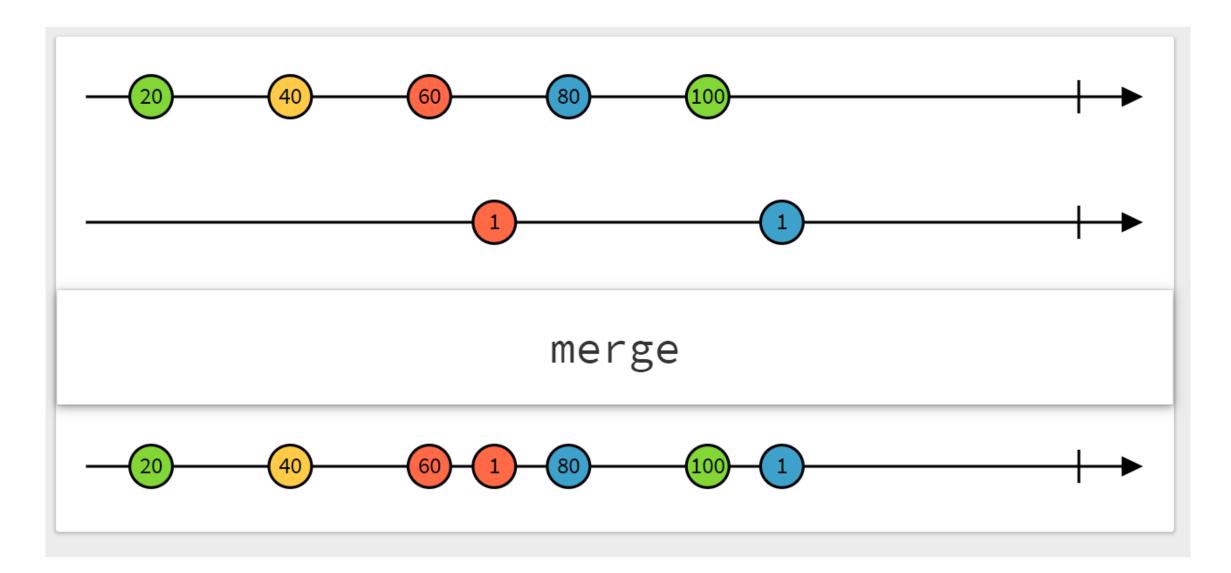

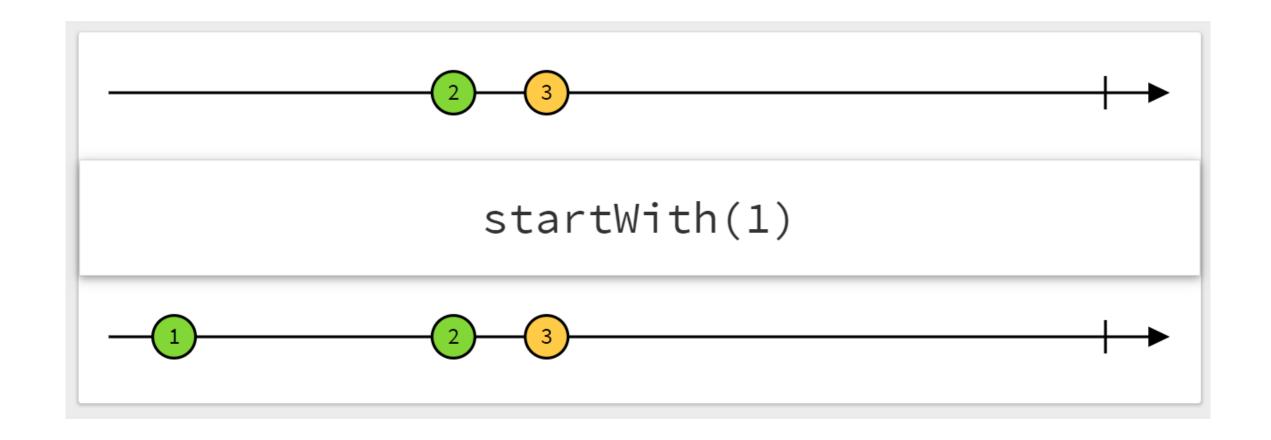

Digression: combineLatest vs forkJoin

combineLatest	forkJoin
Emits whenever all input \$ have emitted at least once.	Emits when all input \$ have been completed.
Multiple emits over time.	Single emit with last values.
Error will stop the emits.	Error will avoid any emit.
Unsubscribing necessary.	Unsubscribing recommended (as almost always).

Demo

Combine Streams

Error Handling

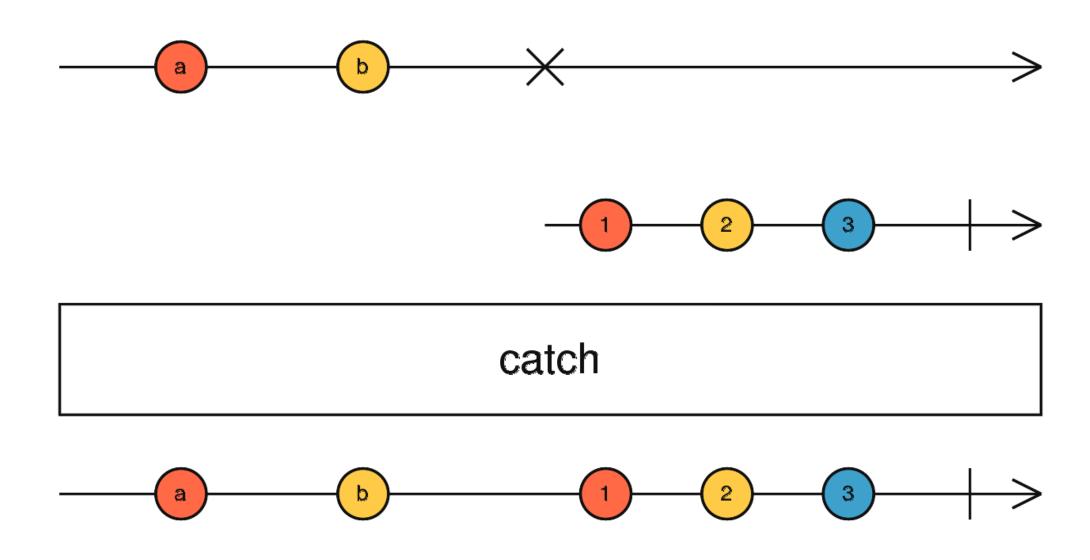

Operators for Error Handling

- catchError
- retry
- retryWhen

• throwError

• finalize

Demo

Error Handling

Taking operators

• take(n)

• first(predicate?: boolean)

takeUntil(observable) & takeWhile(boolean)

Custom operators?

• Operators are functions with input and output of type obsverable

• We can create our own operator function

To avoid code duplications (DRY as ever)

• There is an example at the end of the lab

Lab Time

One more thing ©

Higher Order Observables

Operators for Higher Order Observables

- mergeMap
 - merges outer (source) and inner observables
- exhaustMap
 - outer is ignored until inner is finished
- switchMap
 - inner will be completed after next outer
- concatMap
 - outer will be sent after inner is finished
